

# Navigation-Bar Documentation

The navigation bar is displayed at all times, as its component wraps the entire application. It can dynamically compress on specific routes (e.g., /aiarchitect, /analogguide, or /settings) to optimize screen space. For the Analog Guide and Settings paths, an additional secondary navigation bar is displayed, allowing users to navigate within these sub-routes.

When compressed, the navigation bar features a hover functionality that displays the name of each path when hovered over, enhancing usability. The **Help** button triggers an informational popup, providing users with helpful guidance. At the bottom of the navigation bar, the user information section can be clicked, granting access to user settings and allowing users to log out.
